SUMMARY

Automation Architect focused on AI enablement and applied AI. I replace manual work with systems teams keep using.

- Seedify: rebuilt the failing token-sale snapshot system alone. A run on one network went from 21+ hours to 1.8 minutes. It ran 20+ sales, typically $200k–$900k each.
- Turkish Airlines: built a Word/VBA tool that cut a one-hour document check to 20 seconds. It became mandatory for all quality delegates.
- Seedify: built a Python tool that collects influencer data from x.com. Manual work went from 128 to 8 hours a month.

Now I build rules and skills that make AI coding agents reliable (dev-rules, dev-skills, open source).

TECHNICAL SKILLS

CORE	Python · Bash · Linux · Docker · CI/CD · VBA
AI	AI agents · LLM tooling · benchmark design
PROCESS	process automation · workflow automation · API integration (Google Sheets, Calendar, Slack) · workflow modeling (Bizagi) · stakeholder management
SHIPPED WITH AI ASSISTANCE	Go · Rust · Dart/Flutter · FastAPI

EXPERIENCE

Automation Architect
Apr 2025 – Present

Independent · Remote

- On one benchmark task, AI coding agents passed 0 of 10 runs without rules and 10 of 10 with dev-skills when told to use them. The samples are small.
- dev-rules and dev-skills (32 skills with quality gates) are open source (MIT). I wrote and measured both, and I use them in my own daily work.
- Released: fpstune (v0.2.2), a Windows 11 gaming tuner. In development: aiwe, an engine that turns a goal into verified, merged code with AI agents; dizgin, a container-free sandbox for AI coding tools; and SafeScribe, an on-device transcription app for iOS.

Management Consultant
Oct 2024 – Present

Counseling Practice

- Set up the same operation again when the practice was restructured.

Co-founder & Management Consultant
Jan 2021 – Sep 2024

Counseling Practice

- Built the practice's digital operation alone at its founding: scheduling, spreadsheet bookkeeping, e-invoicing, a cloud phone system and IT purchasing.
- A team of 15–20 practitioners uses the business systems.

Head of Optimization
Apr 2024 – Mar 2025

Seedify (token-launch platform)

- Cut monthly manual work from 128 to 8 hours (16x) with a Python tool that collects influencer data from x.com.
- Replaced manual link collection with a Telegram bot that moderates user-submitted content. KOLs use it self-serve and admins export structured reports in one click.
- Rehired at the owner's request into a new company-wide role, which I ran alone: cross-functional workflow analysis and workflow automation. Connected Google Sheets, Calendar and Slack APIs into a team notification system.

Executive Assistant
Sep 2023 – Nov 2023

Seedify (token-launch platform)

- Built Google Sheets and Calendar API automations, as in every Seedify role.

Project Manager
Feb 2023 – Aug 2023

Seedify (token-launch platform)

- Led a team of 8 to 10 developers and managed stakeholder expectations (CEO and COO).

Blockchain Automation Specialist
Nov 2022 – Jan 2023

Seedify (token-launch platform)

- Scaled the snapshot system from one network to three (BNB, Ethereum, Arbitrum), under 10 minutes together.
- Built workflow automation that connects Slack, Google Sheets and Asana for data and feedback collection.

Distribution Specialist
Apr 2022 – Oct 2022

Seedify (token-launch platform)

- Rebuilt the failing token-sale snapshot system alone, as one Python script: a run on one network went from 21+ hours to 1.8 minutes. It ran 20+ sales, typically $200k–$900k each.
- Every balance now comes from the announced time, so allocation follows the published rule. The colleague who ran the snapshots dropped the old system and used only my script.
- Read the contract code to recover the farm reward formula, then taught it to the engineers who owned the code.

Telegram Ambassador
Nov 2021 – Mar 2022

Seedify (token-launch platform)

- Recruited from the community after the team saw how I helped users. I did not apply.
- Part of a team that represented Seedify on Telegram and gave users technical support.
- Wrote Excel and Google Sheets automations nobody had asked for. The roles that followed came from that work.

Voluntary Developer
Aug 2018 – Jan 2020

EtherGem

- Built Docker and Bash automation to deploy, monitor and auto-update 250+ blockchain nodes on VPS instances.
- The main job was keeping the system up. Nodes kept dropping and needed manual intervention.

Process Improvement Specialist
Apr 2017 – Apr 2018

Albaraka Türk

- Hours of manual work in every process analysis became a one-click re-run. Before, one mistake cost at least 30 minutes of recalculation.
- Mapped current-state workflows step by step with business units and simulated them in Bizagi.

Specialist & QA Delegate
Aug 2014 – Mar 2017

Turkish Airlines

- Built a Word/VBA tool that encodes the department's layout rules and cut a one-hour document check to 20 seconds (180x). The department that owned the standard made it mandatory for all quality delegates.
- Built a VBA rules engine that sorts cabin passenger complaints to the owning department.

Earlier
2013

- An open-source Linux installer script: 69 stars, 25 forks, 3 outside contributors.

EDUCATION

M.Sc., Information Security Engineering - *Istanbul Sehir University* 2017

B.B.A., Business Administration - *Istanbul University* 2011

CERTIFICATIONS

CSM, Scrum Alliance (until 2025)
